

SourcePilot

Spend the money. Prove the limit.

A procurement agent that spends company money inside a limit its owner signed **cryptographically** — enforced on-chain, revocable in one transaction.

THE PROBLEM

Give an agent a corporate card and you have two bad options

● Hand over the card number

The agent holds a 16-digit credential valid at every merchant on earth, for years.

You cannot say “these three suppliers, \$1,840, ninety days.”

● Approve every purchase

Now you don't have an agent. You have a form with extra steps.

Every payment waits on a human who isn't in the room.

The credential can express **that an account exists** — not **what the agent is allowed to do**.

That gap is the whole problem. SourcePilot closes it with a signature.

HOW IT WORKS

One signature. Checked on-chain, every payment.

THE SIGNED MANDATE

Cumulative ceiling	\$1,840.00
Autonomous threshold	\$200.00
Deposit cap	30% of PO value
Approved payees	3 suppliers
Validity window	90 days

EVERY PAYMENT TAKES THIS PATH

1

Off-chain sourcing checks

lead time · spec match · completeness

2

MandateRegistry.record() on Monad

ceiling · payee scope · window · revocation · deposit cap

3

Payment processor

reached only if the contract did not revert

“What breaks if you delete the server’s call to the contract?” The payment loses its authorization and the ceiling stops decrementing.

Compare suppliers

The agent ranks the complete terms — not just the lowest unit price.

- Lead time exceeds the 60-day delivery deadline.

Stop at the approval boundary

The signed mandate makes the agent's authority explicit before any payment side effect.

Authority revoked on-chain

Revocation is a state transition, not an application toggle — later authorization attempts fail.

Authenticated Rain connectivity

A live read-only sandbox call returns HTTP 200; issuance and settlement remain outside this build.

```
> -H "Api-Key: $RAIN_API_KEY" \  
> "$RAIN_API_BASE/issuing/transactions"  
Rain HTTP status: 200  
(base) Yings-MBP:RaingenticCommerceHackathonNYC yingzhou$ jq '{  
>   rainSandboxAuthenticated: true,  
>   endpoint: "GET /issuing/transactions",  
>   httpStatus: 200,  
>   transactionCount: length  
> }' /tmp/rain-transactions.json  
{  
  "rainSandboxAuthenticated": true,  
  "endpoint": "GET /issuing/transactions",  
  "httpStatus": 200,  
  "transactionCount": 0  
}
```

PROOF

Not a diagram. Four public transactions.

Registry deployed block 52019868	0x4fba...4a41	208 tests passing
Mandate created digest recomputed on-chain from 12 signed fields	0x6883...1688	24 Foundry contract tests
\$180 sample recorded spent 18000 → remaining 166000	0xb690...f098	0 processor calls when blocked
Mandate revoked every later payment reverts Revoked	0x48b5...3ded	
Every figure re-checkable: <code>pnpm verify:claims</code> · <code>output/monad/deployment.json</code>		REGISTRY 0x9553c5...dbf1

THE BOUNDARY

What we enforce — and what we don't

ENFORCED BY THE CONTRACT

- Cumulative spending ceiling
- Approved-payee scope
- Validity window
- Revocation
- Deposit cap, via an approval signature verified on-chain

NOT ENFORCED — AND WE SAY SO

- Whether the signed PO value matches the real invoice. No contract can.
- Supplier verification. Out of scope, and we don't claim it.
- Rain sandbox authentication is live. No live issuance or settlement.

Live Rain GET: HTTP 200. For blocked payments, **MockRainAdapter.calls = 0** — Monad remains the gate before mock execution.
